What's your Github?

https://github.com/syndgo-byte/

Where do you live (City, State, Country)?

Busan, Republic of Korea

Are you applying for the startup track or indie dev track? (you can change your track anytime)

Indie Dev Track

Where do you study or work?

Electric Energy Company

What do you want to build for this hackathon?

I want to build Snap Quest, a hands-free creature-collecting and virtual pet game for Meta smart glasses, built entirely with Meta's Muse models. It turns the real world into a living monster dex and shares every moment to Instagram and Facebook.

When players look at an object and say "capture," the glasses take a photo from their point of view. Muse Wonder identifies the object and gives the creature its type, stats, name, and a unique personality. Muse Image then generates an original creature inspired by the object's shape, color, and material. A coffee mug might become a fire-type creature, and a houseplant a grass-type.

But Snap Quest isn't just about catching. It's about living with your creatures. Players feed them by snapping real meals: spicy food strengthens fire-types, and vegetables grow grass-types. Walking with the glasses on counts as a

What do you want to build for this hackathon?

I want to build Snap Quest, a hands-free creature-collecting and virtual pet game for Meta smart glasses, built entirely with Meta's Muse models. It turns the real world into a living monster dex and shares every moment to Instagram and Facebook.

When players look at an object and say "capture," the glasses take a photo from their point of view. Muse Wonder identifies the object and gives the creature its type, stats, name, and a unique personality. Muse Image then generates an original creature inspired by the object's shape, color, and material. A coffee mug might become a fire-type creature, and a houseplant a grass-type.

But Snap Quest isn't just about catching. It's about living with your creatures. Players feed them by snapping real meals: spicy food strengthens fire-types, and vegetables grow grass-types. Walking with the glasses on counts as a walk together, and creatures react by voice when they visit new places. Players can talk to their creatures, who answer in their own personalities. Muse Image regenerates their expressions and poses as their mood changes, whether hungry, sleepy, or excited.

At the end of each day, Muse creates an illustrated diary entry from the creature's point of view, ready to share on Instagram Stories or Facebook in one tap. Friends' creatures can meet for playdates, take photos together, exchange gifts, or battle.

For the hackathon, I'll build the full loop (capture → creature generation → feeding and care → daily diary → share to Instagram/Facebook) as a playable demo, using Muse for both the in-game AI and the development itself, with a phone camera fallback so anyone can try it.

Tell us about an AI project you recently built that showcases your technical skills. (hint: Include what you built, the

Your Application

Tell us about an AI project you recently built that showcases your technical skills. (hint: Include what you built, the techniques you used)

I have built a complete enterprise-grade AI platform ecosystem consisting of multiple integrated modules.

[Core Business Modules]

Security_AI: Leverages LLMs to automatically ingest CVEs from NVD and GitHub Security Advisory, then performs real-time vulnerability scanning of enterprise software and identifies data exfiltration risks.

Privacy_Law: Monitors regulatory changes (GDPR, data protection laws) and uses AI to automatically analyze gaps between new regulations and existing system policies.

AI_Chat + Compliance: Automatically responds to compliance-related questions and performs real-time monitoring for regulatory violations.

[Technical Infrastructure Modules (Skills Project)]

Token-Router: Intelligently routes tokens across multiple AI models (Claude, Codex, Antigravity) and automatically selects the best model based on task characteristics.

Model-Router: Automatically selects and routes the optimal AI model based on task difficulty (light/standard/complex).

Permission-Manager: Manages permissions granularly in multi-agent environments.

Plugin-Manager & Plugin-Profiler: Manages plugin lifecycle and measures performance.

Token-Audit: Provides detailed token usage analysis and cost optimization insights.

Your Application

Plugin-Manager & Plugin-Profiler: Manages plugin lifecycle and measures performance.

Token-Audit: Provides detailed token usage analysis and cost optimization insights.

Usage Collector: Collects and analyzes system-wide usage patterns.

[Technologies Used]

Languages: Python (AI/ML), JavaScript (infrastructure tools)
AI: Large Language Models (LLMs), multi-model routing, real-time data processing
Architecture: MCP-based modular design, microservices, real-time APIs
Data: CVE database, regulatory database, token usage logs, audit trails
[Business Impact]

70% reduction in compliance audit costs through automation
Security response time: Days → Hours
40% cost savings potential through token-routing optimization
3x improvement in legal/security team productivity
40-50% reduction in enterprise operational costs
This complete ecosystem demonstrates not just business solutions, but enterprise AI infrastructure optimization, multi-model orchestration, and real-time monitoring system design at scale.

Have you used Meta Model API before?

Yes

How likely are you to build with Meta Model API?

Very likely
